

Closing the distance between Bosch and the customers it serves.

An internal Customer Experience Platform built to bring customer information into one connected experience at Bosch. Teams across sales, quality, logistics, and engineering often worked with different parts of the customer journey, making it easy for context to get lost. CXP brings together orders, returns, projects, and escalations in one place, helping teams quickly understand the full picture and respond more effectively.

OVERVIEW

Bosch's sales, quality, engineering, logistics, and finance teams all interact with the same customers, but often through different systems and fragmented information. As a result, customer context could easily get scattered, making it difficult for teams to quickly understand the full situation when issues arose. The Customer Experience Platform (CXP) was designed to solve this by bringing orders, returns, projects, escalations, and customer interactions into a single view. I worked on the ideation and concept design of this internal platform, with a focus on helping customer-facing teams access a clear, complete, and decision-ready view of every account.

THE PROBLEM

Bosch's customer interactions were naturally complex, with a single customer often connected to sales, engineering, logistics, and quality teams at the same time. But since each team worked in different systems, there was no shared view tying everything together. During discovery, three key challenges consistently surfaced:

- 🚫

No single view of the customer across teams.
- 🗨️

Communications were hard to track once they moved between functions.
- 📞

Escalations often landed at the wrong point of contact, costing time and trust.

The impact showed up in lower customer satisfaction, missed opportunities, and slower response times — all stemming from the same core issue: no one had a complete view of the customer in one place.

RESEARCH AND APPROACH

We mapped the existing journey with the Business Development team by walking through real customer scenarios end to end. One insight stood out: even senior leaders struggled to quickly understand a customer's context when the account manager wasn't available. That became a key principle for the design — every screen needed to answer: "What does someone at Bosch need to know in the next 30 seconds to help this customer?"

We also approached the product in phases. Phase 1 focused on internal Bosch users and delivering clear customer insights, while Phase 2 was planned to expand the experience to customers themselves. The design needed to stay flexible enough to support both directions.

THE DESIGN

A few key design decisions helped shape the overall experience:

- A landing view designed around attention, not navigation: The dashboard brings key signals like milestone progress, fulfilment, returns, and collaboration insights to the forefront, while highlighting customers who need immediate attention reducing the need to search through multiple screens.
- One customer, one screen: Selecting an account opens a structured tabbed view where metrics, returns, projects, orders, opportunities, payments, and support details all live in one place keeping information connected while staying organised.
- Status that tells a story: For order and return journeys, we designed a timeline that went beyond showing status updates. It highlighted delays, explained why they happened, and showed who was responsible giving teams the context they needed without chasing information across systems.
- Two layout explorations: For the customer detail view, we explored both a structured tab-based metric layout and a more visual card-driven approach to ensure the experience could scale as the amount of information grew.

+20 more screens designed across the complete experience

Some screens and workflows are intentionally not shown due to confidentiality restrictions.

WORKING WITH THE BUSINESS TEAM

Before moving into design, I spent time with stakeholders across sales, quality, and operations to understand not just what data needed to be shown, but which metrics actually influenced decisions. That distinction shaped everything from the dashboard to customer profiles, helping the experience stay grounded in real workflows rather than assumptions.

IMPACT

Selected work is shown here, further project details can be discussed separately

CXP gives any Bosch user whether they regularly manage an account or not enough context to step into a customer conversation with confidence in under a minute. The rollout begins with internal teams that experience these information gaps most often and expands from there. More importantly, it shifts customer experience from being owned by one team to becoming a shared layer that different functions can access, trust, and contribute to together.
